Formation 6 : **Titanic - Machine Learning from Disaster**

KRYPTOSPHERE®

TP : Titanic

- Encoder la BDD puis entrainer dessus un modèle XGboost

- Premières étapes :

1. Aller sur https://www.kaggle.com/competitions/titanic

```python
# This Python 3 environment comes with many helpful analytics libraries installed
# It is defined by the kaggle/python Docker image: https://github.com/kaggle/docker-python
# For example, here's several helpful packages to load

import numpy as np # linear algebra
import pandas as pd # data processing, CSV file I/O (e.g. pd.read_csv)

# Input data files are available in the read-only "../input/" directory
# For example, running this (by clicking run or pressing Shift+Enter) will list all files under the input directory

import os
for dirname, _, filenames in os.walk('/kaggle/input'):
    for filename in filenames:
        print(os.path.join(dirname, filename))

# You can write up to 20GB to the current directory (/kaggle/working/) that gets preserved as output when you create a version using "Save & Run All"
# You can also write temporary files to /kaggle/temp/, but they won't be saved outside of the current session
```

3 fichiers :

- Train sur lequel on va entrainer le modèle (à séparer entre train, val et test)

- Test sur lequel on fait les prédictions pour la soumission finale

- Gender_submission : un exemple de soumission pour le format

Dans l’onglet « data », pour télcharger la dataset

parch: The dataset defines family relations in this way...
Parent = mother, father
Child = daughter, son, stepdaughter, stepson
Some children travelled only with a nanny, therefore parch=0 for them.

gender_submission.csv (3.26 kB)

Objectif

- Prédire la colonne survived 0/1 en fonction des autres données

Grandes étapes

- Importer la dataset
- Split la dataset entrain train, (val) et test
- Drop les colonnes inutiles
- Encoder les chaines de caractères
- Impute les Nan
- Entrainer le modèle
- Faire les prédictions sur le jeu de test
- Submit et regarder le classement
